

VPC End Point Services

Introduction

Before End Point Services

After EndPoint Services

3 A VPC (Virtual Private Cloud) endpoint service is like a special doorway that allows you to connect to certain online services in a secure and private way. Instead of going through the public internet,

4 Endpoint services require either a Network Load Balancer or a Gateway Load Balancer

Considerations

1 An endpoint service is available in the Region where you created it

2 You can access the endpoint service from other Regions using VPC peering.

3 An endpoint service supports traffic only over TCP.
